Project Executable Files

Date	20 October 2026
Team ID	Individual project (no team)
Project Name	Personalized Travel Itinerary Planner
Maximum Marks	3 Marks

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	Yes (backend/schema.sql)
5	Environment configuration file (.env.example or similar)	Yes (backend and frontend)
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Partial (manual tests and performance test report; no automated test suite yet)
10	Demo video or walkthrough (if required)	Yes (link below)

Step 2: File / Folder Structure

```
travel-itinerary-planner/
|-- backend/
|   |-- main.py            FastAPI app: routes, prompt builder, Groq + Supabase calls
|   |-- requirements.txt
|   |-- schema.sql         trips table
|   `-- .env.example
|-- frontend/
|   |-- src/App.jsx        UI: form, itinerary view, saved trips
|   |-- src/main.jsx, styles.css
|   |-- index.html, package.json, vite.config.js
|   `-- .env.example
|-- 1. Brainstorming & Ideation ... 8.Project Demonstration   (project documents)
|-- README.md
`-- .gitignore
```

Step 3: Deployment / Access Details

Hosted / Deployed URL	https://travel-itinerary-planner-beryl.vercel.app
Login Credentials (Demo)	Not required - the application is open without login.
Platform / Hosting Provider	Vercel (frontend), Render (backend), Supabase (database)
Repository Link	https://github.com/niniwritescode/travel-itinerary-planner
Demo Video Link	**[ADD VIDEO LINK]**

Step 4: Run Instructions

1. Create a Supabase project and run backend/schema.sql in the SQL editor.
2. In backend/: pip install -r requirements.txt, copy .env.example to .env and add GROQ_API_KEY, GROQ_MODEL, SUPABASE_URL, SUPABASE_KEY, then run uvicorn main:app --reload (API docs at http://localhost:8000/docs).
3. In frontend/: npm install, copy .env.example to .env (VITE_API_URL=http://localhost:8000), then run npm run

dev and open http://localhost:5173.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Render free tier sleeps when idle, so the first request can take up to about 60 seconds.	Open the site once before use; a paid instance removes the delay.
2	No user login; all saved trips are visible to every visitor.	Planned: Supabase Auth and row level security.
3	The AI can suggest places or costs that are not exact.	Treat estimates as guidance; planned: verify places with a maps API.
4	Regenerate-a-day and group trips are not implemented yet.	Planned for the next phase.
